

4 Different Ways to Access Blocked Torrent Sites

If you're into torrenting, you've probably noticed by now that it is getting tougher and harder to access torrent as well as streaming sites. Government restrictions have made it harder and harder to get online and find the content you're looking for.

The main reason torrent sites are being blocked is because of the disagreement surrounding the content on these sites: after all, most people download copyrighted material, which is illegal. On one side of the argument, there are people who think all content should be free and

available to everyone. Not expectedly, there is quite a bit of overlap with this group and people who upload and download copyrighted content to torrent sites.

Unblock Torrent Sites

With that in mind, how exactly are people getting around these bans? There are several ways to do so, some of them are mentioned below.

1: Https instead of Http

Some simple changes like HTTP to https can make a difference. For example, if you go to <http://www.thepiratebay.org>, then you will get an error message that the site has been blocked as per the order of Indian Government. But, if you just add a security level and type <https://www.thepiratebay.org>, then you will see that the site is accessible. Same can be applied to torrentz.eu and other blocked torrent sites.

2: Tor Browser

To access blocked sites, you can download tor browser ([Download Tor](#))

Tor is great browser, it makes you to browse web anonymously.

3: Proxy

If you are an internet user, then you most probably know what a proxy is. The proxy which is also called a ‘proxy server’ is a gateway between the local network and the internet. When you connect with a proxy, you can access the content you want. There are a number of proxy sites available online which can help you open the blocked sites in India. Remember that proxy is a completely browser-based server, so you cannot use it for non-browser pages or applications which are blocked.

4: Use VPN service

Unlike a proxy, a VPN (Virtual Private Network) encrypts all your traffic by replacing your current ISP with the virtual location as per your preferences. After accessing or downloading the VPN service or software like hidemyass, hola, cyberghost, etc. you can choose your preferred location from anywhere in the world to access the internet and sites that are blocked in your country or region. Some VPN services are free to use, but they can't give surety to hide your IP from the ISP or Indian Government, so it is better to use premium version if you will be using it regularly. Today, browsers like Opera gives an inbuilt VPN functionality which lets you

access the web without using external software or service.
You can try it too.
